Vaporize for your health

by Dean I.

For medical marijuana patients, vaporizing cannabis is a much healthier alternative to smoking. Vaporizers super-heat the marijuana, releasing all the essential elements from cannabis without the harmful toxins associated with burning marijuana. THC, cannabinoids, flavonoids and terpenes are released at various temperatures, and combine into a smooth vapor that is easy on the lungs. The best temperatures for vaping range between 350 and 440 degrees fahrenheit (marijuana burns at 451 degrees fahrenheit).

Vaporizing is more cost efficient than smoking. It's estimated that about 30% of marijuana is "lost" when smoking a joint, pipe, or bong. Vaporizing will remove most of the medicine from the cannabis, but not all. Smart patients use the leftover material, called duff, to make additional medicine, such as tinctures, butter, and capsules. Rather than watching your medicine go up in smoke, maybe it's time for you to invest in a vaporizer!

DID YOU KNOW THAT?

To avoid the toxicity of marijuana smoke – which like cigarette smoke, can cause cancer, lung damage, and pregnancy complications –

**The INSTITUTE OF MEDICINE recommends medical inhalers to deliver the THC.
The Extreme – Q Vaporizer**

How does a vaporizer work?

A vaporizer heats your medical marijuana until the active chemicals boil and vaporize.

Why Vaporize?

Medical marijuana vaporizers can save you from harmful carcinogens entering your lungs and can represent a significant financial saving due to their inherent design efficiencies.

What are the benefits of vaporization?

No smoke is the number one benefit of using a vaporizer. As the medical marijuana vaporizes you will note that a thin mist of vapor is created at this lower 338 F (170 C) temperature. Compare that to a typical marijuana joint which burns at temperatures of up to 2,012 F (1,100 C) and in the process creates many harmful carcinogens. Smoke is the prime cause of lung cancer and many respiratory disorders.

Save money - since vaporization takes place at temperatures below combustion up to twice as many active constituents are delivered to the user that one would get from smoking, according to studies. Cannabinoids are highly combustible, and many delicate glandular trichomes may be destroyed when simply smoked.

No smell – Nothing is actually burning there is very little smell involved with vaporization.
